How the record was made: the measurement model, forward from the truth to the recorded pair
True time
when it happened
Delay after its window
Clock drift
Resynchron-isations
Stamp grid
Recorded time stamp
True value
what it was
Sensor error
Scale factor
Quantisation (A/D steps)
Rounding, heaping
Recorded value
What the atlas does: the correction, from the recorded pair back towards the truth
Corrected pair
Carry the rest
as an interval or a spread:
grid, quantisation, rounding
Undo the measured steps
delay, drift,
resynchronisations, scale
Recorded pair
The corrected pair is a joint distribution over the true time and true value, with its own, smaller, error model
can be undone once measured
many-to-one or random: leaves an interval or a spread
the atlas's correction
